Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Reference mumber: S51330
A;Accession: S51330

A,Molecule type: mRNA A,Residues: 1-13,'V',15-24,'Q',26-44,'N',46-153,'G',155-156,'P',158-171,'K',173-227,'R',' A,Cross-references: EMBL:X83959; NID:g634008; PIDN:CAAS8789.1; PID:g634009

A, Experimental source: clone gfpl A, Accession: S1331 A, Noclecule type: mRNA A, Residues: 1-24, (0, 26-29, 'R', 31-83, 'L', 85-153, 'G', 155-156,'P', 158-171,'K', 173-208,'Q','S A, Cross-references: EMBL:X83960; NID:g634010; PIDN:CAA58790.1; PID:g634011

A)Experimental source: clone gfp2
R)Yang, F.; Moss, L.G.; Phillips Jr., G.N.
submitted to the Brookhaven Protein Data Bank, August 1996
A)Reference number: A65692; PDB:1GFL
A)Reference number: A65692; PDB:1GFL
A)Contents: amordation; X-ray crystallography, 1.9 angstroms, residues 'A',2-79,'R',81-95
A)Note: engineered sequence based on JQ1514, cloned and expressed in Escherichia coli
R)Yang, F.; Moss, L.G.; Phillips Jr., G.N.
Nat. Biotechnol. 14, 1246-1251, 1996
A)Title: The molecular structure of green fluorescent protein.
A)Reference number: A58953; MUID: 98294543; PMID: 9631087

Comment: This protein is excited by the photoprotein aequorin (see PIR:AQJFNV) emittin
Comment: The chromophore of this protein is formed by modification of Ser-dehydro-Tyr-
                                                                                                                                                                                                                                                                                                                   8;

Blochemistry 38:5265-5301(1999).

FUNCTION: Energy-transfer acceptor. Its role is to transduce the blue chemiluminescence of the protein aequorin into green fluorescent light by energy transfer. Fluorescent in vivo upon receiving energy from the Ca(2+)-activated photoprotein aequorin. Absorbs light maximally at 395 nm and exhibits a smaller absorbance peak at 470 nm. The fluorescence emission spectrum peaks at 509 nm with a shoulder at 540 nm.

-! FUNCTION: TRIFUNCTIONAL ENZYME BEARING THE GLN ANIDOTRANSFERASE

(GATASE) DOMAIN OF ANTHRANILATE SYNTHASE, INDOLE-GLYCEROLPHOSPHATE

SYNTHASE, AND PHOSPHORIBOSYLANTHRANILATE ISOMERASE ACTIVITIES.

-! CATALYTIC ACTIVITY: N- (5-phospho-beta-D-ribosyl)-anthranilate = 1-

(2-carboxyphenylamino)-1-deoxy-D-ribulose 5-phosphate.

-! CATALYTIC ACTIVITY: 1- (2-carboxyphenylamino)-1-deoxy-D-ribulose 5-

phosphate = 1-(indol-3-yl)3-lycerol 3-phosphate + CO(2) + H(2)O.

-! CATALYTIC ACTIVITY: Chorismate + L-glutamine = anthranilate +
                                                                                                                                                                                                                                    01-NOV-1988 (Rel. 09, Created)
01-NOV-1988 (Rel. 09, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
Anthranilate synthase component II (EC 4.1.3.27) [Includes: Glutamine amidotransferase, Indole-3-glycerol phosphate synthase (EC 4.1.1.48) (IGPS); N-(5'-phosphoribosyl)anthranilate isomerase (EC 5.3.1.24)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE=86137391; PubMed=2936650;

-1 TISSUB SPECIFICTTY: The major isoform 1 is neuron-specific. It is abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the cerebellum. Expression is located in deeper layers in the developing hippocampus and olfactory bulb, low levels of expression are also detected in the immature striatum. At early developmental stages, expressed also in hypothalamic developmental stages, expressed also in hypothalamic level of expression occurs in the septal area, striatal fields, habenular nuclei, some thalamic nuclei, particularly the lateral geniculate, the retina and some nuclei of the reticular formation in the central field of the medulla. Very low levels found in liver and kidney. No expression in radial galal cells, cortical plate, Purkinje cells and inferior olivary neurons. The minor isoform 2 is only expressed in non neuronal cells. The minor isoform 3 is found in the same cells as isoform 1, but is almost undetectable in retina and brain stem.

--- DEVELOPMENTAL STAGE: First detected at embryonic day 11.5. Expression increases up to birth and remains high from post-natal day 2 to 11 in both cerebellum and fore/midbrain. Expression declines thereafter and is largely brain specific in the adult.

-!- DOMAIN: The basic C-terminal region is essential for secretion.
-!- PTM: N-glycosylated and to a lesser extent also 0-glycosylated.
-!- DISEASE: Defects in reln are the cause of the autosomal recessive reeler (rI) phenotype which is characterized by impaired motor coordination, tremors and ataxia. Neurons in affected mice fail to reach their correct locations in the developing brain, disrupting the organization of the cerebellar and cerebral cortices and other "Evolutionarily conserved, alternative splicing of reelin during brain Cooper J.A., Herz J., "berz J., "Direct binding of Reelin to VLDL receptor and ApoE receptor 2 induces tyrosine phosphorylation of disabled-1 and modulates tau Affects migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and AppoER2 induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation.                                                                                         endoplasmic reticulum.
SIMILARITY: Belongs to the cation transport ATPases family (P-type
ATPases). Subfamily IIA.
                                                              (By similarity). SUBCELLULAR LOCATION: Integral membrane protein. Sarcoplasmic and
             low calcium concentrations. Dephosphorylated PLN decreases the apparent affinity of the ATPase for calcium. This inhibition is regulated by the phosphorylation of PLN (By similarity).
 ENZYME REGULATION: Reversibly inhibited by phospholamban (PLN) at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (BY

-!- FUNCTION: Essential for photosystem II (PSII) biogenesis; putative protein stability or assembly factor for PSII.

-!- SUBCELJULAR LOCATION: Chloroplast; within the thylakoid lumen but attached to the membrane. Restricted to the stronal lamelae.
-!- SINELENEYERCIPICITY: Expression in green tissue, not roots.
-!- DEVELOPMENTAL STAGE: Accumulates also in dark-grown seedlings.
-!- SIMILARITY: Belongs to the ycf48 family.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters (both

The invention relates to an isolated colour-facilitating molecule (CFW)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing ocloured plant

cracts, e.g. flavouring, beverage or juice or colouring agent. Other

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

cract stransducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience W damage e.g. plastics and car

coating materials that experience wolleaving plants. Other contemplated uses include,

coating markers, general reporter molecules, photon traps, UV sinks or

compositery. CFMs embedded in a gel matrix improve image quality in

situations of discorted light spectra (biomatrix). The first all-protein

chromophore to be isolated was Green Fluorescent protein (GFP). The

chromophore to be isolated was Green Fluorescent CFM related amino

acid sequences given in records ABSF6924-ABPPON48 represent CFM related amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QYGSIPFTKYPEDIPDYVKQSFPGRYTWERIMNFEDGAVCTVSNDSSIQGNCFIYHVKFS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                aspera to isolate sequences encoding polypeptides with N-terminal aspera to isolate sequences encoding polypeptides with N-terminal sequences as shown in AAY97147-48. Pigment protein from coral tissue (PPCT) is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 GLNFPPNGPVMQKKIQGWEPNTERLFARDGMLIGNNFWALKLEGGGHYLCEFKSTYKAKK
